Nucleotide sequences encoding mycrene synthase, limonene synthase and pinene synthase from Grand fir may be incorporated into any organism (e.g. intact plant, animal, microbe), or derived call culture that produces geranyl diphosphate for the production of the aforementioned enzymes or their products. The sequences when expressed in transfected ealls may also be used for the production or modification of flavour and aroma properties, improvement of defense capablity, and the alteration of other ecological interactions mediated by mycrene, limonene, pinene, or their derivatives. In particular they can be used for the production of plant seeds for the synthase sequences can be used for the conserved regions of the synthase sequences can be used to create degenerate primers which can be used for screening/amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting tumors using antibodies, antagonists and antisense nucleotides to secretory protein-9 (Zsig9).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present DNA sequence is the antisense PCR primer, that is used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the chromosomal assignment and placement of Zsig9 gene. The gene was mapped to chromosome 12q15 region, on the integrated LDB chromosome 12

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                   New mammalian secretory peptide-9 (Zsig9) - used as a growth enhancer for placenta, liver and heart, and as an indicator of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mycrene synthase; limonene synthase; pinene synthase; flavour; monoterpene synthase; aroma; defense; plant seed; oil; meal; primer; PCR;
                                                                                                                                                                                                                                                                                         This antisense primer, and a sense primer (see AAX06977), were used in a PCR designed to determine the chromosomal assignment of Zaig9 (see AAA06968), a gene encoding new secretory peptide-9 (see AAA088469). Zaig9 was mapped to chromosome 12. The invention provides polynucleotides (see AAX06968-70) encoding Zaig9 polypeptides (see AAW88469-77). Zaig9 can used as a growth enhancer for placenta, liver and heart, and as an indicator of cancer. Antisense nucleotides derived from Zaig9 cDNA, and anti-Zaig9 antibodies, can be used to inhibit the growth of tumour cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated gymnosperm monoterpene synthase DNA - obtained from Grand fir (Abies grandis), used to provide plants with modified production of monoterpenes, e.g. mycrene, limonene or pinene.

region. The move gene encodes a mevalonate kinase enzyme. The enzyme is involved in the mevalonate pathway in the carotenogenic yeast Phaffia rhodozyma. The specification also describes enzymes that are involved in the pathway from isopenteny! pyrophosphate to farnesy! pyrophosphate. The enzymes of the invention are used in the production of isoprenoids and earotenoids, especially astaxanthin. Astaxanthin is useful for the pharmaceutical industry, to protect cells against cancer as it has a strong antioxidation property. Astaxanthin is also useful as a colouring reagent in the farmed fish industry, e.g. salmon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, SRA; steroid receptor RNA activator; cytostatic, antiinflammatory, SRA inhibitor; cancer; infection; antisense oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                  Antisense compounds targeted to steroid receptor RNA activator useful for diagnosis, prophylaxis and treatment of diseases associated with the steroid activator, such as infection, inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is one of a large number of antisense oligonucleotides which is directed against one of four human steroid receptor RNA activator (SRA) nucleic acid sequences. Two series of antisense oligonucleotides were synthesised. The first series comprised 30 oligodeoxynucleotides with a phosphorothioate backbone. The second series comprised chimeric oligonucleotides, which was flanked on both sides by four-nucleotide wings. The wings were composed of a central gap region, consisting of ten 2'-deoxynucleotides, which was flanked on both sides by four-nucleotide wings. The wings were composed of 2'-methoxyethyl (2'-MOE) nucleotides. Both series contained the same nucleotide sequences. The antisense compounds are useful for research, diagnosis, treatment and prophylaxis to prevent or delay infection, inflammation or tumour formation. Therapeutically the oligonucleotides are highly safe and are effectively administered to humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, SRA, steroid receptor RNA activator, cytostatic, antiinflammatory, SRA inhibitor, cancer, infection, antisense oligonucleotide, ss.

Antisense compounds targeted to steroid receptor RNA activator useful for diagnosis, prophylaxis and treatment of diseases associated with the steroid activator, such as infection, inflammation or tumor formation.
                                                                                                                                                                                                 The present sequence is one of a large number of antisense oligonuclectides which is directed against one of four human steroid seceptor RNA activator (SRA) nucleic acid sequences. Two series of antisense oligonuclectides were synthesised. The first series comprised 10 oligodeoxynuclectides with a phosphorothicate backbone. The second series comprised chimeric oligonuclectides composed of a central gap region, consisting of ten 2'-deoxynuclectides, which was flanked on both sides by four-nuclectide wings. The wings were composed of 2'-methoxyethyl (2'-MOE) nuclectides. Both series contained the same nuclectide sequences. The antisense compounds are useful for research, diagnosis, treatment and prophylaxis to prevent or delay infection, inflammation or tumour formation. Therapeutically the oligonuclectides are highly safe and are effectively administered to humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cleavage structure; target sequence detection; flap endonuclease; FEN;

the presence of a target nucleic acid sequence in a sample. The method comprises the formation of a cleavage structure through the incubation of a sample comprising a target nucleic acid sequence and a nucleic acid polymerase and cleaving the cleavage structure with a 5' exonuclease-1 or flap endonuclease (FEN) to generate the signal. The method is used for the detection and quantification of a target nucleic acid sequence. The present sequence represents a fragment of oligonucleotide Heltest4, which is used in an assay to evaluate the activity of a FEN endonuclease. This sequence is the fragment of Heltest4 which is cleaved off by FEN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides the primary nucleotide sequence of the WSBV genome (AAM62689), predicted transcript sequences (AAM62689-AAM62833) and encoded proteins (AAG68910-AAG685051) and oligonucleotide sequences (AAM62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create transgenic viral resistant shrimp. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Primary nucleotide sequence of the shrimp white spot Bacilliform virus (WSBV), useful for producing viral polypeptides that can be used to screen for agents that are useful for treating WSBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Shrimp white spot Bacilliform virus; WSBV; diagnosis; viral infection; antiviral agent; gene expression; antisense construct; probe; primer; transgenic viral resistant shrimp; 8s.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gарв

The invention relates to a method for inhibiting metastasis in a mammal. The method comprises administering an agent which alters the actin-based cytoskeleton of one or more tumour cells in the mammal. It is useful for inhibiting metastatic conditions, such as melanoma and ovarian, prostate, lung, bone, throat, brain, testicular, liver, stomach and pancreatic ancer. The present sequence is a primer used to clone human fibronectin in an example illustrating the invention. The fibronectin gene is one of a group of genes whose activity may be inhibited by the agent of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inhibiting metastasis in humans by administering an agent which inhibits activity of genes which function in regulation of tumor cell metastasis, particularly genes which alter actin-based cytoskeleton of tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sample origonucleotide #22 for analysing nucleic acid base sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding monoterpene synthases, for increasing terpene synthesis in plants, e.g. for increasing resistance to pests or for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of monoterpene synthases from the grand fir. These include (-)-camphene synthase, (-)-beta-phellandrene synthase, terpinolene synthase, (-)-lipha-pinene synthase, limonene synthase, myrcene synthase and pinene synthase. The sequences can be used to produce transgenic plants expressing high levels of the enzymes, resulting in levels which are useful in protecting against and treating cancers, and to confer insect resistance on plants
                                                                                                                                                                                                                                                                                                                                                        90.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

```
acid base sequence. The method comprises preparing a probe array, hybridising with the probe array, measuring the fluorescence yield in the reaction, obtaining a template pattern, producing a sample pattern, and comparing the sample pattern with the template pattern. The method is useful for specifying an unknown base sequence at a defined aite of a target single-stranded nucleic acid, which is useful for analysing a nucleic acid base sequence. The method is applicable in DNA diagnosis and therapy, and is useful in medicine and biology. Measuring the fluorescence yield allows the detection of a one-base mismatch which can be considered to produce high detection accuracy. The hybrid pattern of the DNA probe is used so the difference in thermostability is less important, and the judgement on each spot can be reliably carried out.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present invention relates to a method of analysing an unknown nucleic

Detection of an object component in a sample using an oligonucleotide as detecting probe.

Example 3; Page 19; 25pp; Japanese.

The invention relates to a novel method for detecting a complex formed between a probe and its complex. The method is used for detecting a complex formed between an oligonucleotide of known base sequence and a complementary probe, and for evaluating if the sequence is contained in liquid samples, or the level of binding by using the oligonucleotide as the detecting probe. The sequence represents a probe used in the

Detecting a target nucleic acid in a polymerase chain reaction process comprises forming a cleavage structure by incubating with a probe having secondary structure that changes upon binding and cleaving with a nuclease to release a fragment.

```
The present sequence is the 18-nucleotide cleavage product of FEN nuclease template 1 oligonucleotide, Heltest4 (see ABL54126), which was unclease template 1 oligonucleotide, Heltest4 (see ABL54126), which was the binds to Mil to determining FEN endonuclease activity. Heltest4 complementary 5' overhang. This duplex forms template 2. Template 3 has an additional primer, FENAS (see ABL54127), bound to Mil and is directly adjacent to Heltest4. In the presence of template 3, FENAS binds the free 5' terminus of Heltest4, migrates to the junction and cleaves Heltest4 to produce the present 18-nucleotide fragment. FEN nuclease is preferred for use in the method of the invention, which relates to generating a signal to detect the presence of a target nucleic acid in a sample. In this method, a nucleic acid is treated with a probe that has a secondary structure which changes upon binding of the probe to a target nucleic acid sequence. The invention also provides a process for detecting or measuring a nucleic acid that allows for concurrent amplification, cleavage and detection of a target nucleic acid sequence

The sequence represents a two-base mismatch probe designed to detect a variation a specific base in the p53 gene sequence. The invention relates to a novel method for screening for a variation in a nucleic acid sequence. The method involves using a DNA array in which a group of probes which will give strong signals forming hybrids with a normal gene sequence, and a group of probes having sequences expected to form hybrids with gene variants are separately arranged. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Screening for gene variation by using DNA array in which probes giving strong signals forming hybrids with normal sequence, and probes having sequences expected to form hybrids with variants are separately arranged.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    absence of a gene variation without need of an

In the method of the invention the units for constituting the probe are combined successively and, at the final stage of the successive synthesis, a labelling substance is combined to the end of the probe and extended to a desired chain length. The method of the invention is useful for the production of a probe array. The present DNA sequence represents an oligonucleotide that was used in an example of the invention
                              End-labelled probe array production; probe; 88; target substance capture.
End-labelled probe array production method-related oligonucleotide 22
                                                                                                                                                                                                                                                                                                                                                         invention comprises a method for the synthesis of an end-labelled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

related lectin) protein (1) Pharmacoutical compositions comprising (I) are useful for treating immune system diseases such as asthma, leukaemia or other allergic or inflammatory diseases. Extracellular domains of (I) represent potential markers for screening, diagnosis, prognosis, follow-cc up assays, and imaging methods. (I) is useful as a target for drugs which inflammation, tissue damage and remodeling in asthma, and inflammation, tissue damage and remodeling in asthma, and inflammation, tissue damage and remodeling in asthma, and inflammation, tissue as allergic rhinitis, osteoarthritis, crohn's disease, psoriasis, rheumatoid arthritis, conjunctivitis, etc. (I) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleoid acid molecules (II) encoding (I) are useful in disagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS nucleotides and some of SIGLEC-BMS succession of SIGLEC-BMS succession of SIGLEC-BMS succession of are useful as nucleic acid probes are useful for screening genomic library to isolate a genomic clone of SIGLEC-BMS antibodies are also used to detect, sort or isolate cells the SIGLEC-BMS antibodies are also used to detect, sort or isolate cells are abstant human affects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ABK43360-ABK43411 represent human SIGLEC coding sequences and PCR primers
Novel isolated SIGLEC (sialic acid-binding Ig-related lectin) protein molecules useful for treating immune system diseases such as asthma, leukemia, allergic rhinitis, psoriasis, conjunctivitis, Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated SIGLEC (sialic acid-binding Ig-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.8%; Score 13.8; DB 1; Length 18; 88.2%; Pred. The invention relates to an isolated SIGLEC (sialic acid-binding Igrelated lectin) protein (I). Pharmaceutical compositions comprising (I) care useful for treating immune system diseases such as asthma, leukaemia or other allergic or inflammatory diseases. Extracellular domains of (I) to passays, and imaging methods. (I) is useful as a target for drugs which cinhibit inflammation, tissue damage and remodeling in asthma, and for inhibit inflammation, tissue damage and remodeling in asthma, and inflammatory diseases such as allergic rhinitis, osteoarthritis, crohn's cliesase, psoriasis, rheumatoid arthritis, conjunctivitis, etc. (I) is also useful for monitoring the course of disease or disorders, and for identifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules (II) encoding (I) are useful in diagnosis and/or prognosis methods, and to detect the presence and/or amount of SIGLEC-BMS nucleotide sequences and/or SIGLEC-BMS contains and a biological sample. (II) are useful for screening genemic library to isolate a genomic clone of SIGLEC-BMS antibodies are also used to detect, sort or isolate cells expressing SIGLEC-BMS proteins and in diagnostic imaging technology.

CT he SIGLEC-BMS proteins and in diagnostic imaging technology. The provision of the invarient contains and belongical sample. (II) are useful to sorders associated with SIGLEC coding sequences and PCR primers of hardshology.

The present sequence represents the cleavage product of an oligonucletide used to test FEN nuclease activity. FEN nucleases are used in the course of the invention. The specification describes a method for generating a signal indicative of the presence of a target nucleic acid sequence in a sample. The method comprises forming a cleavage structure comprising duplex and single-stranded nucleic acid, by incubating the target nucleic acid sequence with a probe having a secondary structure that changes upon binding of the probe to the target nucleic acid sequence, and cleaving the cleavable structure with a nuclease to release a nucleic acid fragment. The method is useful for generating a signal indicative of the presence of target nucleic acid sequence in a sample. It is useful in a polywnerase chain reaction (PCR)-based assay or non-PCR based assay for detecting naturally occurring target nucleic acid sequences in a solution including RNA and DNA that is isolated and purified from cells, tissues, cargets in solution, including RNA or DNA oligonucleotides, and peptide nucleic acids

The sample call organisms, bacteria or viruses, and for detecting synthetic acids and pertide acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the reactivity of a first sample with other samples, in which the second to the 2 plus nth (n is not less than 1) samples having different properties are arranged independently on a substrate, on whose surface the first sample is already present, and the reactivities between the first sample and each of the second to the 2 plus n-th samples are determined. Also described is a tissue sample matrix in which several samples from different sources are present on each matrix divided on a substrate. The method is used for determining simultaneously the reactivity of a first sample with several other differing samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Simultaneous testing of the reactivity of a sample with other different samples, comprises applying to the two samples to a substrate comprising divided matrices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the present invention describes a method for determining simultaneously

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises a synthetic DNA selling system using the internet. The system displays a purchase order menu display, with the number of base sequences of DNA from which the orderer selects a DNA. The order information is transmitted to a successful bidder side server which orders for production and delivery of selected synthetic DNA. The system of the invention is useful for marketing synthetic DNAs of different base sequences and concentrations according to the desire of the user, especially genes concerned with human major histocompatibility complex (MHC). Oligonucleotides ABT06196 - ABT06278 are used in the invention
\mathtt{ABLS9636} to \mathtt{ABLS9701} represent oligonucleotide probes used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic DNA selling system using the Internet, displays purchase order menu to orderer's terminal and initiates production of selected DNA for the successful bidder.

This invention relates to a novel method for detecting/measuring a target incleic acid. The method comprises forming a cleavage structure by incubating the target sequence with a probe comprising a binding moiety and a secondary structure that changes upon binding of the probe to the target, cleaving the cleavage structure to release a mucleic acid fragment, and detecting and/or measuring the fragment captured by binding of the binding moiety to a capture element on a solid support. The method of the invention is useful for detecting or measuring a target nucleic acid and are useful for generating a signal indicative of the presence of the target nucleic acid in a sample. Another method of the invention is useful for simultaneously forming a cleavage structure, amplifying the target nucleic acid in a sample and cleavaing the cleavage structure. The method does not require multiple steps, subsequent amplification process, and allows for concurrent amplification and detection of target nucleic
                                                                                                                                                                                                                                                                                                                                                                                                             Detecting/measuring target nucleic acid, by forming cleavage structure by incubating target nucleic acid with probe having binding moiety, cleaving structure to release nucleic acid and detecting released fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ss, PCR, ganglioside GD2-associated tumour; melanoma, antibody;

The invention relates to the recurrence and/or development of a ganglioside GD2-associated tumour, e.g. melanoma, in an individual which is delayed by administration of an antibody comprising light and heavy chain variable region sequences of the anti-idiotype monoclonal antibody IA7. The antibody is used for delaying recurrence and/or development of GD2-associated tumour, e.g. melanoma, neuroblastoma, glandividual, or small cell lung cancer, in individual, and for treating individual with GD2-associated tumour. The present sequence is a PCR primer used to clone vaccinia virus sequences in order to construct an expression vector for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Humanin; neuroprotective; cerebroprotective; cytostatic; immunomodulator; antiinfective; cardiant; gene therapy; neurodegenerative disease; cancer; brain dysfunction; immune disease; infection; digestive disease; circulatory disease; endocrine disease; cell death; ds.

The invention relates to a novel humanin-like polypeptide. The activity of the polypeptide of the invention may be described as neuroprotective, cerebroprotective, cytostatic, immunomodulator, antiinfective and cardiant. The polypeptide is applicable in diagnosis and remedies or preventives as well as screening drugs, including for example those for neurodegenerative diseases, cancer, brain dysfunction, immune diseases, infections, digestive diseases, circulatory diseases and endocrine diseases. The polypeptide of the invention also has cell-death inhibitory properties, and may be used in gene therapy. The current sequence represents a humanin-like protein related DNA fragment
                                                                                                             Novel humanin-like polypeptide with cell death-inhibitory activity, applicable in diagnosis and remedies or preventives as well as screening drugs for e.g. neurodegenerative diseases and cancer.
                                                                                                                                                                                                           Disclosure; Page 80; 87pp; Japanese

Identifying modulators of apoptosis, in particular binding modulators of humanin to bax or bid, useful for diagnosing and/or treating disorders such as Alzheimer's disease, Parkinson's disease, cancer and inflammatory disorders

Example 3; Page 86; 141pp; English.

The invention relates to method for identifying an effective compound

```
ö
that modulates the binding of humanin to bax and/or bid. The method is useful for diagnosing and/or treating disorders associated with the humanin-bax or humanin-bid complex, such as Alzheimer's disease, stroke, Parkinson's disease, Huntington's disease, trauma, amyotrophic lateral esclerosis, neuron cell death, cancer or inflammatory or autoimmune disorders. The present sequence is a PCR primer used for amplifying human humanin cDNA. This sequence is a PCR primer tee for amplifying human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              recruiting a tumor-specific response against glycosphingolipid GD2, useful for treating a GD2-associated disease e.g., melanoma, glioma, soft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a monoclonal antibody 1A7 (an anti-idiotype antibody eliciting an anti-GD2(ganglioside) response). Also included are an antibody producing cell deposited under ATCC Accession No. HB-11786 (or its progeny), a polynucleotide comprising a sequence encoding a polypeptide with immunological activity of 1A7 (where the polypeptide comprises at least 5 consecutive amino acids from a variable region of 1A7), an isolated polynucleotide comprising a region of at least 20 consecutive nucleotides that is capable of forming a stable duplex with a polynucleotide encoding the light or heavy chain variable region of 1A7 under conditions where the region does not form a stable hybrid with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 monoclonal antibody; 1A7; anti-idiotype antibody; ganglioside GD2;

8x333333 셤 polynucleotide consisting of a variable region encoding sequence appearing as ADC1521 - ADC15370, a host cell comprising the appearing as ADC1521 - ADC15370, a host cell comprising the polynucleotide, a fusion polypeptide comprising 1A7, a humanised antibody comprising to antibodies from the iA7 variable regions and a vaccine comprising the antibodies. The antibodies are useful for eliciting an immune response in an individual, and for treating a GD2 associated disease is another and remember and individual has a clinically detectable tumour, and the method is for palliating the GD2-associated disease. 1A7 is preferably useful for treating a tumour that was previously detected in the individual and has been treated and is clinically undetectable at the time of the administering of 1A7, or for reducing the risk of recurrence of a clinically detectable tumour. 1A7 and the humanised antibody are useful for detecting the presence of an anti-GD2 antibody are construction of a vaccinia virus vector expressing the light or heavy chain variable regions of monoclonal antibody 1A7

New oligonucleotides, useful for rapid detection of beer-spoilage bacteria by in situ hybridization, are specific for type, genus or

The present invention relates to an isolated human olfactory receptor, family 1, subfamily 6, member 1, (ORIG1) polymorlectide comprising a sequence which is a polymorphic variant for a reference sequence for the ORIG1 gene or its fragment, or a polymorphic variant of a reference sequence for a ORIG1 cDNA or its fragment. ORIG1 is useful in studying the expression and function of ORIG1 and in expressing ORIG1 protein for use in screening for candidate drugs to treat diseases related to ORIG1 activity. ORIG1 is useful for therapeutic purposes. The invention is useful for studying expression of the ORIG1 isogenes in vivo, for in vivo screening and testing of drugs targetted against ORIG1 protein, and for testing the efficacy of therapeutic agents and compounds for olfactory sensory deficits, in a biological system. The invention is useful in gene therapy and is located on the . The present sequence is human ORIG1 gene polymorphism detecting ASO (allele specific oligonucleotide) probe

Novel isolated human olfactory receptor, family 1, subfamily G, mem polynuclectide, for therapeutic purposes, for studying expression av function of the polynuclectide and for expressing receptor protein.

This invention describes novel oligonucleotides used in a method for detecting beer-spoilage bacteria in a sample. The bacteria detected include lactic acid bacteria of the genera Lactobacillus or Pediococcus, especially the species L. coryniformis, L. perolens, L. buchneri, L. plantarum, L. fructivorans, L. lindheri, L. casei, L. brevis or P. Amannosa or Gram-negative bacteria of the genera Pectinatus and Megasphaera, specifically P. frisingensis, P. cerevisiphilus and M. cerevisiae. The oligonucleotides of the invention provide rapid detection

The present invention describes genetic variants of the human glutathione reductase (GSR) gene (1). (1) has antianaemic activity and can be used in gene therapy. (1) can be used in screening for drugs targeting (1) that are useful for treating heemolytic anaemia. Methods from the present invention can be used: for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with GSR activity; for haplotyping, which is also used by the pharmaceutical research scientist to validate GSR as a candidate target for treating a specific condition or disease predicted to be associated with GSR activity, e.g. haemolytic anaemia, and in the consist of clinical trials for treating a specific condition of disease condidated with GSR activity, and for screening compounds targeting GSR. (1) is useful in studying the expression and function of GSR. and in the expression of the waitain on the biological activity of GSR activity. (1) is also useful in studying the condidate drugs are treatment of the binding affinity of candidate drugs targeting GSR for the treatment of the binding affinity of candidate drugs targeting GSR for the treatment of the exemplification of the present sequence represents an allele specific of lagewing a single nucleotide polymorphism) in the present invention)

Constitution of the present invention. N.B. The polymorphic base (showing a single nucleotide polymorphism) in the present invention)
                                                                                                                                                                                                                                                                                              Human; glutathione reductase; GSR; enzyme; haemolytic anaemia; SNP; gene therapy; antianaemic; polymorphic; single nucleotide polymorphism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New genetic variants of Glutathione reductase isogenes, useful for improving efficiency and reliability in drug development for treating hemolytic anemia.
                                                                                                                                                                                                                                                       Human GSR allele specific oligonucleotide primer SEQ ID NO:39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BP; 1 A; 0 C; 0 G; 13 T; 0 U; 1 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human adenosine A3 receptor (ADORA3) gene located on chromosome 1p21-p13, and methods for haplotyping and/or genotyping the ADORA3 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOB) as probes and primers and/or primer-extension oligonucleotides for detecting the ADORA3 gene polymorphisms. The polymucleotides and screened compounds are useful for the treatment of diseases associated with ADORA3 activity, such as pathophysiological conditions of the heart e.g. myocardial isohaemia and chronic heart failure. ABK92603-ABK92628 represent ASO primers for detecting human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel genetic variants of the adenosine A3 receptor, useful therapeutically and in screening for drugs to treat diseases related ADORA3 activity e.g., myocardial ischemia and chronic heart failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This invention describes novel derivatised solid supports of formula S'-L-Z-GIZCH2-R, where: S' = a solid support; L = a bond or an (in) organic linker; Z = SOZ or S-S; R = OH, an H-phosphonate, alkanephosphonate, phosphotriester, phosphite triester, phosphorame, or phosphorame, or an optionally substituted or modified nucleotide (N'), or an oligonucleotide of formula (N') SR2; g = 1-200; R1 = a protecting group; R2 = an H-phosphonate, alkanephosphorate, phosphorate, p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RSCHEMIZER/CHEMIZER AND MENTIONE AND MENTIONE AND CONTRIBUTION OF A CONTRIBUTION OF 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Derivatised solid supports and reagents for oligo:nucleotide synthesis and new oligo:nucleotide phosphoramidate conjugates.
                                                                                                                                                                                                                                                                                                             (SLOK ) SLOAN KETTERING INST CANCER RES. (ZWBI-) ZW BIOMEDICAL RES AG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 44; 68pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New genetic variants comprising haplotypes of the cyclin-dependent kinase 4 (CDK4) gene, useful in improving the efficiency drug screening protocols for compounds targeting CDK4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated polynucleotide comprising fragments and haplotypes of the cyclin-dependent kinase 4 (CDK4) gene. Human CDK4 gene is located on chromosome 12q13 and contains 8 exons. The haplotypes and polymorphisms of CDK4 gene are useful for validating whether CDK4 is a suitable target for drugs to treat cancer, melanoma and disorders associated with impaired protein synthesis in cells, screening for such drugs and reducing bias in clinical trials of such drugs. Haplotype information would be useful in improving the efficiency and output of several steps in the drug discovery and development process, including target validation, identifying lead compounds, early phase clinical trials. The present secening for compounds targetting CDK4 to treat a specific condition or disease predicted to be associated with the condition or disease predicted to be associated with the present sequence is a ASO primer used for detecting

Amixture of oligonucleotides (AAT86601-3) were separated by a new process using capillary affinity gel electrophoresis. The invention relates to selective separation of electrically charged target molecules in an analytical mixture. It comprises capillary affinity gel electrophoresis using a capillary tube which is at least partly filled with a polymer agel. Receptors for target molecules are covalently bound to the polymer. An electric field of at least 50 volts/cm is applied. The capillary tube is charged with the analytical mixture. In a first separation stage, the target molecules in the mixture are bound to the receptors and the remaining components are eluted, optionally whilst components are eluted, optionally whilst splitting open. In a second stage, the elution conditions are changed, optionally in stages, so that the affinity of the target molecules for the receptor is eliminated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation and/or determination of charged organic compounds, such as oligonucleotides, peptides or carbohydrates. It may be used, e.g. for isolation of specific proteins and DNA molecules, purification of antibodies, analysis of antisense compounds or screening for enzyme inhibitors. The process achieves higher resolution and selectivity than prior art processes, especially in the case of complex biological canalytical mixtures. It has high sensitivity, even with small amounts of samples. The derivatised polymers may be synthesised specifically using espandard methods
                                                                                                                                                                                                                                                                                                                               Separation of electrically charged target molecules - by capillary affinity gel electrophoresis using polymer-gel to which receptors for

A new method useful for diagnosing human adenocarcinoma and measuring metastatic potential comprises determining the levels of macrophage migration inhibitory factor within tumor cells. WPI; 2000-292363/25.

Claim 11; Col 7-8; 6pp; English.

This invention describes a novel method for diagnosing adenocarcinoma and determining metastatic ability of human cancer in an individual by determining the increased levels of macrophage migration inhibitory factor (MIP) within tumor cells. The method is useful for diagnosing human adenocarcinoma, as well as for its prognosis. The method is also useful for measuring levels of macrophage migration inhibitory factor within tumor cells. The method provides better and more accurate prognostic markers for cancer. The method is also capable of alstinguishing histological tumors from clinical cancers. This sequence represents a primer used to detect the human MIF gene D5k region which is

                                                                                                                                                                                                                                                                                  The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF$151 and AAF$153-F$151). The method is useful for ameliorating the effects of psoriasis, ichthyosis, picyriasis, unb, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood
Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 creeptor, IGF binding protein [IGFP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, coligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the affects of portagis, coligonuclectide which ameliorating the effects of psoriasis, replaying the method is useful for ameliorating the effects of psoriasis, chhyosis, pitziasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic condition of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

ö
               skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-Ike Growth Factors [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAF45153-F4516). The method is useful for ameliorating the effects of psoriaais, ichthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein, IGFB-2; IGFBP3; inflammation, psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contexting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 7; Page 45; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, infilammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense of the present invention (see AAF45151 and AAF45153-

The present invention relates to a method for ameliorating the effects of antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, ruba, planis, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a polynucleotide sequence that is a polymorphic variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene also referred to as cyclooxygenase 2. The human PTGS2 gene sequence AAP80896 contains 27 single nucleotide polymorphisms (SNPB). AAP80896 and AAP80897 represented by AAB72199. The invention includes PCR and sequencing primers, and probes represented in AAP80898 - AAP81151 which are used to isolated and characterise the PTGS2 gene sequence, and to coate the positions of the SNPB. PTGS2 proteins and polymucleotide sequences are used to express variant PTGS2 proteins, for structural analysis or drug-binding studies and also in gene therapy (either sepressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are useful for diagnosis, prognosis and therapy and analysis of the new, and known, polymorphisms and used to determine PTGS2 palotype and genecype, especially for determining association between a particular trait, e.g. clinical response to drugs that target PTGS2 but also disease of inscending diagnostic testes and treatments for immune-related disorders such as arthritis and inflammation. The polymorphisms may also be used to study expression and biological function of PTGS2. Transgenic animals that express PTGS2 are used to study expression and biological function of PTGS2.
                                                                                                                                                                                                       .;

```
This invention relates to oligonucleotide analogues comprising a protein nucleic acid molecule (DNA) monomer. They are used in the detection and separation of nucleic acid molecules and as probes, primers, linkers, adapters and antisense agents on solid supports. Modifications enhance their use as capture and detection probes e.g. by the incorporation of blotin, digoxigenen, radioisotopes, fluorescent labels such as fluorescent and reporter molecules such as alkaline phosphatese. They are closed for enhancing or inhibiting the activity of an enzyme or also used for enhancing or inhibiting the activity of an enzyme or cellular activity. The polyamide backbone of PNAs is resistant to both nucleases and proteases. PNAs bind nucleic acid molecules with greater affinity than DNA or RNA concentration. The compounds are relatively simple to synthesize and are used in a wide variety of applications. This sequence represents a DNA oligoner which is used to represent the effect of single base mismatches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotides analogs useful in detection, separation and purification of nucleic acid molecules, comprise monomers, dimers and oligomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression.

Example 6; Fig 20A; 108pp; English

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel or ienteation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, creplication or virulence, reducing their pathogenicity. Alternatively, pathogen which is not found in the genome of pathogen; shows of triple-helix oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or virule. origin. Such therapeutic oligonuclectides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing so preferentially killing or repressing the cancer causing present sequence represents an oligonucleotide used in the methods of the present invention

                                                                                                                                                                                                                              The invention describes adaptor molecules, where each end of the adaptor is compatible with a nucleic acid digested with a restriction enzyme or a nucleic acid comprising an end that is compatible with a nucleic acid digested with a restriction enzyme. The adaptor molecules, compositions, kits and arrays are useful for cloning nucleic acid molecules that does not require the design and synthesis of oligonuclectides or PCR primers. The adaptors, kits and arrays are also useful for ligating two ends of a single nucleic acid molecule, or ligating two or more nucleic acid molecules. The kits can also be used for performing internal deletion mutagenesis analysis. The adaptor molecules are ligated to a cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mutagenesis analysis. The adaptor molecules are ligated to a cioning vehicle, making the cloning procedure more rapid and efficient, and less error-prone. This sequence represents a nucleic acid cloning associated
                                                     New adaptor molecules, useful for cloning nucleic acid molecules that does not require the design and synthesis of oligonucleotides or PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The adaptor molecules, compositions, kits and arrays are useful for cloning nucleic acid molecules that does not require the design and synthesis of oligonucleotides or PCR primers. The adaptors, kits and arrays are also useful for ligating two ends of a single nucleic acid molecule. Or ligating two or more nucleic acid molecules. The kits can also be used for performing internal deletion mutagenesis analysis. The adaptor molecules are ligated to a cloning vehicle, making the cloning procedure more rapid and efficient, and less error-prone. This sequence represents a nucleic acid cloning associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a novel method of inhibiting the expression of one or more genes or RNA transcripts by administering at least one oligonucleotide analogue that includes at least one hydroxyproline nucleic acid (HypNA) monomer to a cell or organism or their extracts. Throlloging sene expression, respiration, secretion, signalling, innectance channel activity, cell motility, developmental phenotype and tumour regression. Furthermore, they may be utilised to determine the effects of particular genes, as antisense or homologous recombination constructs e.g. for creating animal models of disease and finally, for increasing the activity of some enzymes, such as polymerases. The current sequence is that control of the single-base mismatch oligonucleotide SEQ ID 12 DNA of the invention. This sequence may also comprise a peptide nucleic acid (PNA), a phosphono-PNA (PPNA) or a HypNA.

The sequence depicts a HIV viral duplex sequence which contains a purinerich region concentrated on one chain of the duplex. The sequence may be prepd. by standard DNA synthesis. The HIV duplex sequence is used as a target for novel oligomers which are capable of forming a triplex at physiological pH by coupling into the major groove of the DNA duplex. Three such oligomers HIV141 -HIV143 are capable of forming a triplex with this sequence. The oligomers are used in the diagnosis and therapy of HIV infection. Similar oligomers are used in the diagnosis and therapy of HIV infection. Similar oligomers may be used to target viral DNA duplexes specific for hepatitis, herpes and malignancy. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer is able to inhibit gene expression, as verified by in vitro systems See also AAQ23452-25551 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is for detecting viable Cryptosporidium parvum cells by hybridising specifically to unique 18S rRNA sequences of C. parvum. It can be used when labelled as a probe or as a primer for PCR amplification of 18S rRNA. It can detect live C. parvum occysts, or other cells, particularly in water but also in other environmental or clinical samples such as animal or human body fluids or excretions. It does not detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    viable Cryptosporidium parvum cells - in 18S rRNA, useful as probe or primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cryptosporidium parvum; 18S rRNA; ribosomal RNA; detection; diagnosis; polymerase chain reaction; hybridisation probe; 88.
oligomers contg. modified bases - which form a triplex with G-C blet in a DNA duplex, for treating and diagnoging HIV, hepatitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.8%; Score 13.4; DB 1; Length 16; 93.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an oligonucleotide array comprising array is useful for genotyping a nucleic acid sample at one or more loci array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNE). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to

The present sequence is that of a single mismatch target sequence for a molecular beacon comprising an oligonucleotide probe (see ABL57069) covalently attended at the 3' end to fluorescent dye and at the 5' end to conformation with hybridised termini. The probe forms a hairpin conformation with hybridised termini. The probe forms a hairpin and quencher (gold nanoparticle) in the molecular beacon results in little or no detectable fluorescence. Upon hybridisation of the central complementary stretch of the probe to a target sequence, such as the present sequence, the hairpin undergoes a conformational change resulting in an increase in fluorescence, the extent of which is proportional to the amount of target sequence present Experiments with the present sequence and a perfectly-matched target (see ABL57071) showed that hybridisation was very specific to the matched target. The invention relates generally to the use of metal surface quenchers such as particles or films for high sensitivity applications in, for example, detection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sensitively detecting proximity changes in a system that utilizes an interacting fluorophore and quencher, for high sensitivity applications, involves utilizing a metal surface as quencher.
                                                                                                                                                                              Molecular beacon; fluorophore; nanoparticle; nucleic acid detection; ss.

The present invention describes a composition (I) suitable for administration in a mammal, which comprises a modified oligonucleotide containing 7 or more contiguous ribose groups [III] of 7-75 nucleotides containing 7 or more contiguous ribose groups condified oligonucleotide is complementary to a region of a gene associated with a pathological disorder. Also described: (I) a comprising (II), where the modified oligonucleotide is complementary to a region of a gene associated with a skin disorder. (I) and (II) can have hypotensive, antilipaemic, vasotropic, dermatological, antidepressant, tranquilliser, antiliflammatory, antilucer, laxative, antimigraine, neuroprotective, antiparkinsonian, analgesic, gynaecological, virucide, vulnerary, antiarthritic, antimicrobial, cytostatic and litholytic activities (I) can be used for treating a patient with a pathological disorder selected from abnormal appetite, hypertension, hypercholesterolaemia, hyperligidaemia, erectile dysfunction, eczema, depression, anxiety, stress, inflammatory bowel syndrome, ulcerative colitis, Crohn's disease, renal stones, gall stones, constipation, colds, migraine headache, seizure, multiple sclerosis, polymyostis, sinustis, chronic pain, pre-menstrual syndrome, trauma, carpal tunnel syndrome, chronic fatigue syndrome, rosacea, arthritis, psoriasis, prostatis, inflammation, heart burn, infection, poison ivy, colon cancer, malignant mealanome, and malignant masal polype. The nutritional supplementic number of the supparance of the shin in an engage of the skin in an engage of the skin in an engage of the skin in an engage of the shin in an engage of the skin in a second enga
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     individual with a skin disorder. A novel method for the detection of plant pathogenic strains of fungine. Septoria nodorum, S. tritici, Pseudocercosporella herpotrichoides, Mycosphaerella fijiensis, M.musicola or Fusarium spp, involves the PCR amplification of sequences found in the internal transcribed region (ITS) of the 18S, 5.8S and 28S ribosomal RNA genes by the primers AAQ94359-93 and AAT05379-72. These primers are derived from the ITS sequences of these fungi (AAT05394-T05404 and AAQ94389) and are strain specific. The amplification products of the reactions using these primers can be used with the capture primers AAT05378-93 in colourimetric assays. The primers and ITS DNAs can be used for the detection of specific fungal pathogen isolates and in monitoring disease development in plant populations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for detecting interactions between biological components using a nonlinear optical technique. The invention is used for screening candidate binding partner(s) for binding to test molecule. It can also be used to detect changes in orientation or conformation of the probe and/or target. The present sequence is a target oligonucleotide used in nonlinear optical technique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening candidate binding partner(s) for binding to test molecule by applying external force field to sample in homogeneous phase, illuminating sample with light beam(s) at fundamental frequencies, and

                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                              AAQ81619 and AAQ81620 are a pair of primers for the PCR amplification of the P. falciparum MSA-1 gene, used in the production of new recombinant povairuses containing either the SERA, ABRA, Pfhsp70, AMA-1, Pfs25, Pfs16, CSP, PfSSP2, LSA-1, LSA-1 repeatless, MSA-1, MSA-1 (N-terminal p83 or C-terminal gp42) genes, or combinations of these in non-essential regions of their genomes. These poxviruses (pref. with a virulence reducing genomic deletion or disruption) can be used as vaccines against malaria and for the prodn. of Plasmodium immunogens. These viruses provide multicomponent, multistage vaccines due to their expression of sporozite, liver stage, blood stage and sexual stage proteins. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb,

                                                                                                                      The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This primer is an example of a "bumper" primer, for the gag gene of HIV It is used in a modified version of thermophilic strand displacement amplification (tSDA) to amplify double stranded DNA in situ.

Amplification primers (see AATR8932-3) are hybridised to both strands of the gene, and are extended. Both primers have a restriction endonuclease (RED recognition site, and the products will also contain these sites. The products are displaced from the target sequence, by extension of the bumper primers, which anneal upstream of the amplification primers, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of nucleic acids in cells - by in situ amplification of target sequences by thermophilic strand displacement amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gape

made double stranded by synthesising complementary strands. Making the products double stranded causes "nicks" to be created (via the RE recognition sites). Furthur extension occurs from the nicks, thereby displacing a copy of the target sequence from the double stranded amplification primer extension products. The nicking, extending and displacing steps are repeated, and the target sequence amplified in situ. The method can be used for the amplification of DNA in situ in cells in suspension, on slides or in tissues, with speed, sensitivity and specificity. In situ tSDA also remains compatible with immunochemical techniques in spite of the increased reaction temperature so both amplification of DNA and immunological staining (see AAT88934 for an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (ILL-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (Ilk-1) (e.g. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be tracted by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; MSD; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention describes nucleic acid molecules which modulate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                               Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Sequences AAV62507 to AAV62566 represent species specific PCR primers for various fungal isolates used for fungal detection in the course of the invention. The primers are designed based on the internal transcribed spacer (ITS) sequences of the various fungal species. The invention provides a DNA molecule isolated from the ribosomal RNA gene region of fungal pathogen, where the DNA molecule consists of an ITS sequence selected from ITS and ITS of Fusarium culmorum, Pusarium graminearum, Fusarium moniliforme, Septoria avenae or Microdochicum mivale. A method for detecting F graminearum, F. moniliforme, F. poae, F. avenaceum and M. nivale isolates is also provided which comprises isolating DNA from a plant leaf infected with at least one of the above pathogenical pathogens and amplifying parts of the ITS sequence of the pathogen(s) by PCR using specific primers from within these sequences. The pathogen(s) by are detected by visualising the amplified part of the ITS sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidabetic; ophihalmologic; antiinflammatory; antiathritic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase i (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17165 to AAA1765 and AAA1885 and AAA19087 to Corresponding target sequences; and AAA19155 to AAA1915 to AAA1915 to AAA1768 to AAA1915 to AAA1915 to AAA1915 to AAA1915 to AAA1915 to AAA2165 and AAA1915 to AAA2165 and AAA2165 and AAA2165 and AAA2165 and AAA2165 to AAA2165 and AAA2165 to AAA2165 and AAA2169 to AAA2168 represent their corresponding target sequences; AAA21689 to AAA2165 and AAA2167 to AAA21689 to AAA21689 represent their corresponding target sequences for integrin subunit beta 3, and AAA2347 to AAA23343 to Corresponding target sequences for integrin subunit beta 3, integrin subunit beta 3, integrin subunit beta 3, integrin subunit beta 3, integrin subunit beta 6 integrin subunit beta 7, integrin subunit beta 8 integrin subunit beta 9 integrin subunit beta 9 integrin subunit beta 8 int
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                detection assay to determine the presence, absence or amount of a target analyte in a sample. The method and kit may be used to detect amplification of nucleic acid molecules in real time using fluorescence quenching for example. The assays may be used to detect the presence of nucleic acids from pathogens in samples of body fluid from patients. The kit allows a homogeneous nucleic acid amplification and real time nucleic acid probe detection assay to be carried out with minimal complexity which yields a consistent reliable fluorescent detection signal. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

invention. It was used to normalise the CDNA sequences in a sample for study, which then enabled the PCR amplification of 'rare' sequences i.e. those which are not found most often in the sample. This is useful in procedures such as gene identification, particularly those genes itenscribed at low levels, therapeutic protein identification, to variations within the human genome such as single nucleotide polymorphisms, identification of differences between normal and diseased tissue and analysis of differential gene expression between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is an adaptor sequence used in the method of the

                                                                                                                                                                                                                                                                                                                                         ö
The present invention is concerned with a number of human single nuclectide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

These SNPs can be used in disease diagnosts and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and

The present invention describes a recombinant vaccinia or avipox virus (RV1) containing DNA coding for Plasmodium falciparum (Pf) merozoite surface antigen 1 (MSA1) or its subfragment, operably linked to a promoter for controlling expression of the DNA. The subfragment of Pf (1) consists of an N-terminal 83 kDa fragment or the N-terminal 83 kDa fragment of Pf MSA1. Also described are: (1) a recombinant vaccinia or aripox virus (RV2) containing a DNA coding for a subfragment of Plasmodium MSA1 of the Uganda Palo-Alto isolate of Pf, operably linked to promoter for controlling expression of DNA, the subfragment of Plasmodium MSA1 of the Uganda Palo-Alto isolate of Pf, operably linked to promoter for controlling expression of DNA, the subfragment of plasmodium MSA1 of the Uganda Palo-Alto isolate of cacids 1-752 and 1333-1726 of Plasmodium MSA1; (2) an immunological composition for inducing an immunological response in a composition for inducing an immunological response incertie; and (3) producing Plasmodium MSA1 or its subfragment invention can have antimalarial activity, and can be used in vaccine production. RV1 or RV2 is useful for inducing an immunological response in a host eaginst Plasmodium infections such as malaria. The present sequence represents a PCR primer for the MSA1 N-terminal, which is used in an example from the present for the combinants of N-terminal fragments of MSA1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       useful for inducing immunological response in host against Plasmodium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel recombinant vaccinia or avipox virus containing DNA encoding
Plasmodium falciparum merozoite surface antigen 1 or its subfragment,

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 game or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 30; Page 168; 200pp; English.

expression of a cucleic acid molecule which down regulates expression of a nucleic acid molecule which down regulates expression of a nucleic acids molecule which down regulates expression of a nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaving RNA with a NYN motif) propessessing an NCH motif), a G-cleaving RNA with a NYN motif) propessessing an NCH motif), a G-cleaving RNA with a NYN motif) propessessing an NCH motif). The CD2-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg-2+.

C of CD20 in the presence of a divalent cation that is preferably Mg-2+.

C but any be contacted with a cell to reduce CD20 activity of the cation appears the use of one or more the call and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more the call and treatmaia, HV (human immunodeficiency virus) associated NHL, lymphoma, HV (human immunodeficiency virus) associated NHL, lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO cat argetting nucleic acid is used to cleave RNA of the NOGO gene in the immunodeficiency arthropathy. The NOGO cat a divalent cation that is preferably Mg-2+. Furthermore, the contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucleic acid may further comprise the use of one or more contacted with a cell to reduce NOGO activity of the nucleic acid may be contacted with a cell to reduce NOGO activity of the nucle nucleic acid may be contacted with a cell to reduce NOGO activity of the nucle nucleic acid may therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy.induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob The invention relates to a nucleic acid molecule which down regulates

an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA cc confoct of the presence of a divalent cation that is preferably MG<sup>2</sup>+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CC of CD20. The treatment may further comprise the use of one or more cherapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular noncervative lymphoma (MCL), immunocytoma [IMC], small B-cell lymphocytic lymphomy, concervative lymphoma, manunocytoma [IMC], small B-cell lymphocytic lymphoma, concervative lymphocytic lymphoma, manunocytoma inflammatory arthropathy. The NOGO-c targetting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the cargetting nucleic acid may be contacted with a cell to reduce NOGO activity of the conclain and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of the NOGO. The treatment may further comprise the use of one or more cell and treat a patient aving a condition associated with the level of creat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), parkinson's disease, muscular dystrophy, and/or other neurodegenerative disease contacted to the nodulation of NOGO expression. The present contacted to the nodulation of NOGO expression. The present

```
The present invention provides single-stranded oligonuclectides which can be used for the targeted alteration of genomic sequences, where the oligonuclectide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKNZA), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein E (APOB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protein (APC), presentiln-1 (PSENI) and presentiln-2 (PSENI2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, haemoghila, hypercholseterolaemia, thalassaemia, sickle cell anaemia, chalmier's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting coligonuclectides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB; mismacch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein B; LDLR; familial hypercholesterolemia; UGTI; syndrome; APP; FSENI; antisense; UDP-glucuronosyltransferase; amyloid precursor protein; presentilin-1; Albehmer's disease; cytostatic; antisickling; antianaemic; haemostatic;

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CDKN2A), APC, Factor VIII, Factor IX, haemoglobin alpha locus (CDKN2A), APC, haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein B (APOB), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presenilin. 1 (PSEN1) and presenilin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis, hypercholesterolaemia, thalassaemia, sickle cell anaemia, hampinia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, various syndromes. The present sequence is one of the gene correcting oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Evaluating a cellular response to an environmental compound, for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; Estrogen response element; ERE; DDRT-PCR; ss; PCR primer; differential display of reverse transcribed mRNAs by PCR; testicular cancer; brostate cancer; endometrial cancer; asthma; hypospadia; cryptocrinsm; allergy; hormone replacement therapy; HRT; endocrine system; HTICT.
                                                                                     Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical

The sequence represents a downstream PCR primer used in a DDRT-PCR experiment (and in cDNA synthesis), demonstrating the method of the invention. The method relates to evaluating a cellular response to an environmental compound, comprising determining or comparing the environmental compound, comprising determining or comparing the environmental compound, comprising determining or comparing the environmental compounds that act on the level of endogenous gene adapted to identify compounds that act on the level of endogenous gene expression through activating nuclear receptors. The method is useful in toxicological analysis, diagnostics, for diagnosing cancer (e.g. cryptorchism and/or allergy, and endometrium), asthma, hypospadia, cryptorchism and/or allergy, and for evaluating the efficiency of a treatment for hormonal deficiency or hormonal replacement therapy, in a treatment for hormonal deficiency or hormonal replacement therapy, in cryptorchism and/or allergy, and for evaluating the efficiency of a treatment such as a post-menopausal female. The method is also useful for identifying environmental chemicals or pharmaccutical compositions that capitally using a sensitive technique, and for detecting chemicals that pose a rapidly using a sensitive technique, and the expression of any gene can be monitored. The assays are far more informative than the currently used assays, and significantly reduces the number of animals required for the company of the c
  toxicological analysis, involves determining or comparing the expression

The present invention describes a method for differentiating bacteria by

```
ö
using primers or probes having different base sequences. The method can be used for the differentiation or detection of Shigella flexneri, Shigella boydii, Shigella connei or Salmonella typhi, Salmonella parathyphia, Salmonella typhimurium, Salmonella chester, Salmonella enterfitdis, and Salmonella cranienburg spp. bacteria. The method can be used for rapid differentiation of 9 lines of bacteria for prevention, diagnosis and treatment of diseases caused by these bacteria. The present sequence represents a detection probe which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-

nucleic acids can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify to browner; nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 crowled initial substrates for the recombinant engineering of hGDMLP-1 capture improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption insistion, as therefore an acid in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a clisorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO car fitp.wipo.int/pub/published_pct_sequence

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterises and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 proteins as immunosens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for dagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynuclectide sequences of hGDMLP-1 (can be used in gene therapy and vaccine production. The hGDMLP-1 cucleic acids can be used as probes to detect, characterise and quantify chicked acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ioniation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymuclectide sequences encoding hGDMLP-1 and statement sequence expression of hGDMLP-1, in particular heart of showing-1 sequence represents an oligomer used in the screening of the hGDMLP-1 sequence exemplification of the present invention. N.B. The sequence data for this parent did not form part of the printed and the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                 New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                      Shannon ME

The present invention describes a human genome-derived myosin-like protein 1 (hdDMLP-1). The protein and polynucleotide sequences of hdDMLP-1 can be used in gene therapy and vaccine production. The hdDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hdDMLP-1 nucleic acids in samples, as amplification substrates to hdDMLP-1 protein tenintial substrates for the recombinant engineering of hdDMLP-1 protein variants having desired phenotypic improvements, and for capture proteins. The hdDMLP-1 proteins or polypeptides may be used as immunospes to raise antibodies that specifically recognise hdDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hdDMLP proteins as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therefore the partial proteins or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The characteristic sequences encoding hdDMLP-1 may be used for diagnosing a disorder associated with the expression of hdDMLP-1, in particular hart and skeletal muscle disorders hdDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hdDMLP-1 sequence data for this patent did not form part of the printed capture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionication, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. hGDMLP-1 sequence data for this patent did not form part of the printed production in the screening of the heart section of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                      Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
Human GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:10281.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chen W,

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 call a caids can be used as probes to detect, characterise and quantify nucleic acids in samples, as amplification substrates, to protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specific blomclecule and to and for amount specifically of hGDMLP proteins, as specific blomclecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and unsacle disorders hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                       Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart;
muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease;
skeletal muscle disorder; amplicon; screening; 88.
                                                                                                                                   fuman GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:10283.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Shannon ME
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chen W,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-therapeutic supplement in patients having specific deficiency in hGDMLP-therapeutic supplement in patients having specific deficiency in hGDMLP-therapeutic supplement in patients having specific deficiency in hGDMLP-1 may be used for diagnosing a disporder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 calcided acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to protein variants having desired phenotypic improvements, and for protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The groundlectide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart of and skelatal muscle disorders. hGDMLP-1 is localised to chromosome 22. The sequence represents an oligomer used in the acreening of the hGDMLP-1 for the present invention. N.B. The sequence data for this patent did not form part of the printed for this patent did not form part of the printed for the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                specification, but was obtained in electronic format directly from WIPO

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein variants having desired phenotypic improvements, and for correspond to raise antibodies that specifically recognise may be expressing the proteins. The hGDMLP-1 proteins or polypeptides may be can simmunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapulate proteins or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence of this patent did not form part of the printed capture data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO cat fig...
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                            New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the respective supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed appearance in the exemplification of them part of the printed appearance or the present invention. The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 claim be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1, may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart;

                                                                                                                                                                                                                                                                                          ABN10028;
                                                                                                                                                                                     RESULT 1444
                                                    S'''원
                                                                                                                                                                                                                                                                    The present invention describes a human genome-derived myosin-like protein 1 (hGMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunosquas to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as theorem or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. heavened at a for this patent did not form part of the printed production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

The protein and polynuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP receips, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO te fip. wipo.int/pub/published_pct_sequence

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78752 and ABS98519 to ABB98520). HTPL has two isoforms, with a few single base pair changes introduces a between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall features strongly inply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome lopp.1. HTPL and its coding sequence are therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potential therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protain; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV7875 to ABV78762 and ABB9819 to ABB98520). HTPL thas two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome lolpl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorders include disorders of testis, or adrenal, and the HTPL. Such disorders include disorders of testis, or adrenal, and the cotal liver, bone marrow, brain, kidney, lung, placenta, prostate, cotal liver, bone marrow, brain, kidney, lung, placenta, prostate, cotal miscally useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention

Claim 4; Page 122; 149pp; English

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, malanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, malanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, culgarist, angiofibroma of tuberrous sclerosis, port-whise stains, Sturge Conditions, Kippel-Trenaunay-Weber syndrome, Obler-Weber-rendu (Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with an evel (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I) (I) is useful for cleaving RNA of ERG gene, by contacting the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect CC the presence of ERG RNA in a cell. (I) is useful for specifically ctargeting genes that share homology with ERG gene or ERG fusion genes. ARK1354-ABK22719 represent nucles which regulate expression of ERG, and and ensymmatic nucleic acide, including antisense and ensymmatic nucleic acide molecules which regulate expression of ERG, and ensymmatic nucleic acide, including antisense and ensymmatic nucleic acide, including antisense of ensymmatic nucleic acide, including antisense of ensymmetric profession of the invented of the invent related PCR primers of the invention

Novel polynucleotide which down regulates expression of Ets-related genuuseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 75; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, metanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, verruca vulgaris, angiofibroma of tubberous sclerosis, port wine stains, Sturge vulgaris, angiofibroma of tubberous sclerosis, port wine stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of advalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ARX.7354-ABKZ2719 represent nucleic acide, including antisense and enzymetic nucleic acide, including antisense and enzymetic nucleic acide molecules which regulate expression of ERG, and related PCR primers of the invention

```
The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sacroma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, thousand all abetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tubbarous sclerosis, port-wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu Syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and enzymmatic nucleic acid molecules which regulate expression of ERG, and enzymmatic nucleic acid molecules which regulate expression of ERG, and enzymmatic nucleic acid molecules acids, including antisense and enzymentic nucleic acid molecules acids, including antisense and enzymmatic nucleic acid molecules acids, including antisense and enzymmatic nucleic acid molecules acids, including antisense and enzymmatic nucleic acid which regulate expression of ERG, and enzymmatic nucleic acids under a cide and

useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome. Novel polynucleotide which down regulates expression of Ets-related useful for treating cancer, diabetic retinopathy, macular degenerati

Randi AM;

Mcswiggen JA, Mclaughlin F,

Claim 4; Page 70; 149pp; English

conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, cumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Nippel-Trenaunay-Weber syndrome, Osler-Weber-rendu sclerosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of advalent cation such as Mg2+. (I) is useful for diagnostic fool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for ERG gene or ERG fixed or ERG fusion genes.

CHE TREE CHE CHE CHE STRA in a cell. (I) is useful for specifically caracting genes that share homology with ERG gene or ERG fusion genes.

CHE STRATASA-ABK22719 represent nucleic acids, including antisense and encymentation of the presence of encymentation of ERG and and encymentation The invention relates to a nucleic acid molecule (I) which down regulates related PCR primers of the invention

Sequence 17 BP; 2 A; 2 C; 10 G; 0 T; 3 U; 0 Other;

                                                             셤
```

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, malanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, malanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, convocation, mayopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Oller-Weber-rendu Syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent carlon such as Mg2+. (I) is useful for diagnosis of conditions and diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically

Novel polynucleotide which down regulates expression of Ets-related genuseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                   ABKI7354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention
  targeting genes that share homology with ERG gene or ERG fusion genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;

chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABRIT3514 PEREZEIT represent nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention
                                                                                                                                                                                                                                      Gaps

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition

Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma.

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by clearing RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic ibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition casociated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, cartifacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect Claim 4; Page 135; 152pp; English.

Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma.

New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; huma; cancer; prostate cancer; REL-A activity; breast cancer; huma; lung cancer; prostate cancer; clorectal cancer; brain cancer; prostate cancer; olovectal cancer; pancreatic cancer; cervical cancer; atomach cancer; odder cancer; malanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitars! doctars! cipplatin; methotrexate; cyclophosphamide; doxorubin; fluorouracil carboplatin; edatexate; gemcitablne; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn; disease; besity; laschaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents an isolated nucleic acid sequence associated

The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents an isolated nucleic acid sequence associated
                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid sequences associated with tumor suppression, regres apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; tumour suppressor; antitumour; cytostatic; tumour suppression; tumour regression; apoptosis; virus resistance; diagnosis; cellular degeneration.
the presence of CLCA1 RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention
                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The earzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for clearing RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methoticxate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide are also useful for treating inflammatory disease such as cheumatoid arthritis, restenosis, athama, Crohn's disease such as observed and molecules are also useful for treating inflammatory disease such as observed and molecules are also useful for treating inflammatory disease such as cheumatoid arthritis, restenosis, athama, Crohn's disease, diabetes, observed the content of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    an enzymatic nucleic acid molecule (I) which down
allergic airway inflammation; inflammatory bowel disease; infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Seguence 17 BP; 4 A; 7 C; 5 G; 0 T; 1 U; 0 Other;

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 39; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor Kappa B (MPKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG'2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophagaal, stomach, bladder, pancraatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischemia/reperfusion injury a novel enzymatic sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymat (CNS) and myocardial), glomerulonephritis, (central nervous system nucleic acid molecule

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRA), where (I) is an inozyme, zinzwe, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg-2 +. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oseophageal, stomach, plandder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodices, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel enzymatic nucleic acid molecules which down regulates expression of

configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antiense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oeophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, and and asease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemid/reportuse, or processes, ranges, ranges, especial subtances, mydered, central nervous system (CNS) and myocardial), glomerulonephritis, sepace or radiation contents and second contents and seco

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor sequlates expression of a sequence encoding a subunit of nuclear factor of kappa B (NFKB), where (I) is an inozyme, Zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gane, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, corrical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug cervicals as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, colornation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as content and antisense nucleic acid molecules are also useful for treating inflammatory diseases such as content and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia, repertication injury (central nervous system (CNS) and myocardial), glomerulonephitis, sepsis, allergic airway inflammation, inflammatory bowel disease or This sequence represents the substrate of a novel enzymatic nucleic acid molecule

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 38; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, panoreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamich, docetaxel, cisplatin, methotrexate, cyclophosphamich, docetaxel, cisplatin, methotrexate, cyclophosphamich, docetaxel, cisplatin, edatrexate, cyclophosphamich docetaxel, asthma, crohn's disease such as acid molecules are also useful for treating inflammatory disease such as relection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, cepsis, allergic airway inflammation, inflammatory bowel disease or inflection, englated represents the substrate of a novel enzymatic nucleic acid molecule

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is concoded at chromosome 7q22.1, MD24 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome cor in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23. MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids and also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as cuccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

A CARCING AS TO

ADB02201

developmental disorder;

```
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6921.3-22.2, MDZ7 is encoded at chromosome 6921.3-22.2, MDZ7 is encoded at chromosome 6921.3-22.2, MDZ7 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome second in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ1; hDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.8%; Score 13.4; DB 1; Length 17; 93.3%; Pred. The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15p2.1.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome cor in manufacturing a medicament for treating or preventing a disorder casociated with decreased or increased expression or activity of MDZ3. MDZ4, MDZ7, or MDZ12. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and lso be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as the present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MD23; MD24; MD27; MD212; chromosome 7g22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15g26.1; cancer; developmental disorder; ss.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD21, MD23 is encoded at chromosome 7022.1, MD24 is encoded at chromosome 7022.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 16p21.3-20.2, MD27 is encoded at chromosome 16p21.3-20.2, MD24, MD27, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross acids can also be used as probes to detect and characterize gross are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                               Human, ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule interpretation and immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV accivity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, also useful for canner, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ65220 - ABZ65224, ABZ65530 - ABZ65224,
also useful for treating breast, ovarian, colorectal, lung, prostate, baladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ6524, ABZ66530 - ABZ66536 represent substrate/target sequences for the human

The nucleic acid molecule activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acid solecules are useful for reducing also useful for treating breast, ovarian, colorectal, lung, prostate, also useful for treating breast, ovarian, colorectal, lung, prostate, shown in NEZ59889 - ABZ62216, ABZ64544 - ABZ66531, ABZ66520 - ABZ66224, ABZ66530 - ABZ66531, ABZ65531, ABZ65531, ABZ65324, ABZ65531, ABZ65531, ABZ65534, ABZ65534, ABZ65534, ABZ65530 - ABZ65534, ABZ6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential theraples directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and the invention are useful for the treatment of degenerative and disease states related to HBV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  na. The present sequence represents a substrate for one of the HCV or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                      RNA stability; RNA expression; RNA synthesis; antisense; enzymetic nucleic acid; hammerhead riboxyme; MYAzyme; inozyme; decoy molecule; aptamer; tribozyme; decoy molecule; aptamer; thus reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver fallure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

```

```
The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                          Cytostatic, virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                           Murine oligonucleotide associated with tumour supression, SEQ ID 2499.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss;

fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 8% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides, or the complement, or corresponding RNA, of the nucleotides The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to preper transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, the containing the polypeptides and also be used to screen for their specific interactive molecules.

Homo sapiens

Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic

Slettan A, Hoyum M, Lingaas

Lie O,

WPI; 2003-627388/59.

comprising

The present invention describes an isolated nucleic acid (I)

Claim 18; SEQ ID NO 507; 233pp; English.

```
fragments of at least 15 consecutive nucleotides of these nucleotides, a gequence having at least 18 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the cuncleotides, The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour cupression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                 detecting,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       single nucleotide polymorphism; SNP; fish; Salmo salar;

control present invention describes an isolated an indicated acid of salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs; and (ii) an uncleic acid having nucleotide sequence that hybridises to conditions.

Also described: (1) an isolated oligonucleotide (II) comprising at least on its complement under highly stringent hybridisation conditions.

Also described: (1) an isolated oligonucleotide (II) comprising at least or inloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, code polymorphic sites and seabass polymorphic sites, or their complement; (2) applier pair (III) suitable for use in PCR, comprising two (II) capable of amplifying a nucleotide sequence chosen from S. salar SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, Code injoicius SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, code conjuicity of tish sample comprising providing a parent genotype comprising a collection of candidate parent genotype of candidate parent genotype to the parentage genotype database, where a match between conjuicate parent genotype to the parentage genotype database, where a match between the sample genotype and one of the candidate parent genotype in the sample conjuicate parent genotype to the parentage genotype database, where a match between the sample such as family salmonidae, S. salar, Tilapa, O. niloticus for the sample such as family salmonidae, S. salar, Tilapa, O. niloticus at sample, which is detecting nucleic acid molecule comprising contacting the sample containing nucleic acid molecule comprising contacting the sample containing nucleic acid molecule comprising contacting the sample contacting the sample, comprising contacting the sample contacting the sample contacting the sample contacting the sample contacting nucleic acid molecule confidence in a sample, comprising contacting nucleic acid molecule comprising contacting nucleic acid molecule comprising contacting nucleic acid molecule comprising contac

                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to antisense compounds targetted to a nucleic acid encoding thyroid hormone receptor interactor 6 (TRIP6) to inhibit its expression. TRIP6 is also known as OPA-interacting protein-1 (OIP-1) and zyxin-related protein-1 (SAP-1). TRIP6 DNA is located on chromosome 7q22. Antisense compounds of the invention are useful for modulating the expression of TRIP6 and for treating diseases or conditions associated with the expression of TRIP6 such as hyperproliferative disorders (e.g. cancer). They are useful for disgnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as tesearch reagents and kits and in distinguishing between functions of various members of a biological pathway. The are also useful in antisense therapy. The present sequence is an antisense oligo targetted to human TRIP6 DNA. This oligo is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides targeted to nucleic acids encoding thyroid hormone receptor interactor 6, useful for diagnosing or treating hyperproliferative disorders, such as cancer.

Sequence analysis revealed the Sequences of 25 cDNA clones, which were then searched against DNA databases for homology to known human genes. The cDNA mols. can be used for the prodn. of gene specific primers and probes to isolate genes induced by treating (esp. human) chondrocytes with interleukin-lbeta (IL-lbeta), and for the diagnosis of IL-lbeta related connective tissue diseases, in partic. oseteoarthritis or rheumatoid arthritis

display, in the method of the invention. The specification describes a method for measuring the level of two or more nucleic acid molecules in a method for measuring the level of two or more nucleic acid molecules in a target. The method comprises contacting a probe with an arbitrarily or statistically sampled target and detecting the amount of specific binding of the target to the probe. The methods can be used to identify differentially expressed nucleic acid molecules associated with disease states, such as cancer, autoimmune disease, infectious disease, aging, developmental disorder, proliferative disorder or neurological disorder. Alternatively the methods can be used to assess the efficacy or toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in response to a stimulus, e.g. a chemical, drug or growth factor (especially epideranial growth factor), radiation, stress or a pathogen. The methods can also be used to determine co-regulated genes that can be potential targets for drug discovery
                                                                                                                                                                                                                                                                                                                       Measuring expression of low abundance reduced complexity target nucleic acid molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequential consensus region-directed amplification; gene expression; disease diagnosis; gene analysis; human; matrix metalloproteinase; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligo-dT PCR primer #6 used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.8%; Score 13.2; DB 1; Length 14; 92.9%; Pred.                  Sequential consensus region-directed amplification for sorting mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples, useful for disease diagnosis and gene analysis.
                                                                                                                        The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is oligo dT PCR primer used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is oligo dr PCR primer used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequential consensus region-directed amplification for sorting mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples, useful for disease diagnosis and gene analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequential consensus region-directed amplification; gene expression;
disease diagnosis; gene analysis; human; matrix metalloproteinase; PCR,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligo-dT PCR primer #2 used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta and; or (X)m5'-(gamma) k-delta-N3'; where X = a labelled compound and/or nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and detdermination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptides having at least two new nucleotides - useful as primers in RT-
